

Are You Ready for Higher Yields?

Achieving the next generation of yields will require a complete package of high-technology inputs, new management practices and crop fertility. Review the checklist below to see if your crop production program is ready for the higher yields needed to meet future demand for food, feed, fiber and fuel.

- I have a fertility plan for every field. Page 20
- I have made management changes to ensure I'm optimizing the return on my investment in seed. Page 8
- I agree the triple-stack hybrids I'm planting yield more and need a higher level of fertility to fulfill their yield potential. Page 2
- My fertilizer application rates have increased as my yields increase. Page 2
- I have a regular, systematic plan to soil-test every field on my farm to make sure soil nutrient levels have not decreased below critical levels. Page 13
- I am experimenting with higher plant populations on my farm. Page 8
- In the past three years, I have seen corn plants on my farm showing pale striping of the leaves. Page 22
- Sulfur is a nutrient that may be needed on my farm. Page 14
